Abstract: User generated content published via weblogs (also known as blogs) has gained importance in the last years, and the number of globally available weblogs increases. However, a large fraction of these show low publishing activity and are rarely read. This paper is a quantitative analysis of success factors in a community of over 15.000 weblogs, hosted by a local Austrian newspaper. We looked at publishing activity by content type, community activity and writing style. Also, the interconnectedness of the community was analyzed.

Keywords: User Generated Content, Weblog Analysis, E-Communities, Blogging

Categories: H 3.5, H.4.3, H.5.1

1 Introduction

In the age of the so-called Web 2.0, user generated content is credited increasing importance, as *participation* is one of the key characteristics of this concept [O'Reilly, 05]. Such content is gradually complementing and, in some cases, even contesting information provided in a classic, published environment. Especially in the news domain, weblogs (also known as blogs) have become an important source of information beside newspaper websites. This paper will focus on such *user generated content* published via weblogs.

The key question we asked ourselves in this context is: What makes a weblog successful? In the context of this research, success is measured by the number of visits to a blog. For the use in this analysis, visits were counted as unique IP addresses, counting a new visit after 20 minutes of inactivity. So, the question can be reformulated as: what are the factors that lead to a high number of visits of the content created by the users?

Another interesting aspect of user generated content is the community of the involved users. Possible questions in this context concern the structure of this community. Is the community divided into smaller communities or is there a central group of active users?

2 Related Work

Quite a lot of research on weblogs has been published in the recent years. Interesting in this context are publications on ranking weblogs like [Kritikopoulos, 06]. The authors present a modification of the PageRank algorithm [Page, 98] designed to take into account the links between the blogs and the similarity of the users, as well as links to non-weblog URLs.

[Du, 2006] tries to answer the question for success factors of weblogs from a technology perspective. The study analyzed the impact of technology used on the success of 126 blogs taken from the top 100 listings of the Technorati¹ website. In the case of Technorati, success is measured by the number of inbound links to a blog.

As far as the analysis of weblogs communities is concerned, [Cohen, 06] counts connections by hyperlinks and relation by type or topic as possible relations forming communities of weblogs. This point of view focuses on the relations provided in the content of the weblog. A complementing approach, as presented in [Li, 07] is to take into account the information available from the guest comments to the entries.

To the best of our knowledge, our work is the largest quantitative analysis of success factors for weblogs to date.

3 The Analysis

The “Meine Kleine” Weblogs² of the local Austrian “Kleine Zeitung” newspaper offer a promising possibility to take a closer look at a large number of weblogs in a relatively closed environment. Users of this environment have the ability to publish text and images (photos) to their own weblogs. In addition, comments as guestbook entries can be written to the weblogs of other users.

By November 21st 2006, the blogspace consisted of 15702 active blogs, ranging from topical weblogs by the newspaper’s editors to private diaries of individual readers. In our research, we had access to the servers log files as well as the database holding the weblog entries. The log files and entries from Oct 7th to Nov 21st 2006 (about 6 weeks) were analyzed in the course of this project.

3.1 Basic Statistics

The community of Kleine Zeitung readers consist of a large number of more than 118,000 registered users. Of those, 15702 have activated the weblog for their account and had at least one visit in the analyzed 6-week period. 560 of those bloggers were active publishers in this period, meaning they added content to their weblog in these 6 weeks. This, together with the fact that only the top 1730 weblogs had five or more visits in this period, resulted in our decision to take only the 2000 most visited weblogs into account for all further examinations (see Figure 1).

The publishing activity of the examined users was quite incoherent. The number of (text) entries published ranged from 0 to 45 for the individual blogs. The most active poster of images published 469 images in the examined period. As far as the

¹ <http://www.technorati.com>

² <http://www.meinekleine.at>

activity in the community is concerned, the most active users posted 80 comments and 137 guestbook entries in other users' weblogs. Figure 2 shows the different forms of publishing activity for the user with the 20 most-visited weblogs.

Figure 1: Distribution of visits of the top 2000 weblogs

Figure 2: Publishing Activity of the 20 most-visited weblog users

3.2 Activity of Authors vs. Readers by Time of Day

Beside the basic statistics of the weblogs, an investigation of the user activity in the course of a day has been carried out. On the one side the activity of the content authors, those users creating text entries or uploading photos, shows an almost even distribution throughout the day, with one peak at noon and one in the early evening. This is in contrast to our assumption that most users would be contributing content to their blogs in the evening and in a home environment. This assumption is true,

however, for the posting of comments, which mainly occurs between 19:00 and 22:00. Figure 3 shows the significantly different graphs for publishing own content versus activity in the community (i.e. writing comments and guestbook entries in other users' weblogs).

Figure 3: Creation of Content and Comments in the course of a day

On the other hand, the activity of the visitors of the blogs in the course of a day was also investigated and viewed separately for the different types of content. As with the authoring activity, reading is almost evenly distributed from 7:00 to 23:00. Peak usage is from 19:00 to 22:00, which corresponds to the peak in commenting. The visits of guestbook entries vary from this general observation, as they have a peak in the early afternoon and none in the evening (see Figure 4).

Figure 4: Views of different content types in the course of a day

4 Influences on Popularity

The main focus of the research on the “Kleine Zeitung” blogspace was to find and verify factors for the success of weblogs. Based on the available data, we decided to analyze nine possible criteria, arranged into three groups.

4.1 Influence of Content Types provided

In a first step the different types of content composing the blog were analyzed on their impact on the popularity. The visits of the individual blogs were compared to the number of textual entries, photos and the days the user was active in the period investigated. The highest correlation could be found with the user’s active days, being 0.68. The correlation to the entries and images were lower, at 0.60 and 0.53, respectively.

4.2 Influence of Community Activity

Secondly, the influence of community activity was investigated. We decided to analyze the correlation of comment and guestbook activity, outbound as well as inbound. The highest value was found for the obvious correlation of received comments and visits to the blog with 0.77. The number of guestbook entries received correlates with 0.69. For own comments and guestbook entries in other blogs the correlations are 0.70 and 0.68, respectively (see Figure 5).

It should be noted that these correlations coefficients are higher than those of publishing content. In other words, in order to have a highly visible weblog, it is even more important to be active in the community than to publish own content regularly! This true for the individual correlations as well as for the summary of content provided respectively own community activity. There is a total correlation of 0.61 of content provided to the number of visits, while the correlation of community activity to number of visits is 0.71.

Figure 5: Influence of content provided and community activity on popularity

4.3 Influences of Writing Style

A further aspect of the research investigated upon the contents of the Kleine Zeitung blogspace is the influence of the author's writing style. For this purpose, the similarity computation of the Autonomy Search Engine, which is based on Bayesian Inference [Autonomy, 07], was used.

The blog entries of the top 2000 blogs were compared to the editorial blogs of the Kleine Zeitung (written by professional journalists) and to the top 5 blogs. In both cases the correlation was very low with coefficients of determination of under 0.20. Thus no reliable statement is possible.

5 Communities in "Meine Kleine" Weblogs

As the previous chapter showed, the activity within the community is a crucial factor for the success of a weblog. In a final step of our research, we tried to visualize the communication between the community members by comments and guestbook entries. In the resulting graphs, the members of the community are depicted as nodes and links resulting from comments or guestbook entries as edges. A Fruchterman-Reingold force directed placement algorithm [Fruchterman, 91] was chosen for the graph for a comprehensive visualisation of the interconnectedness of the community.

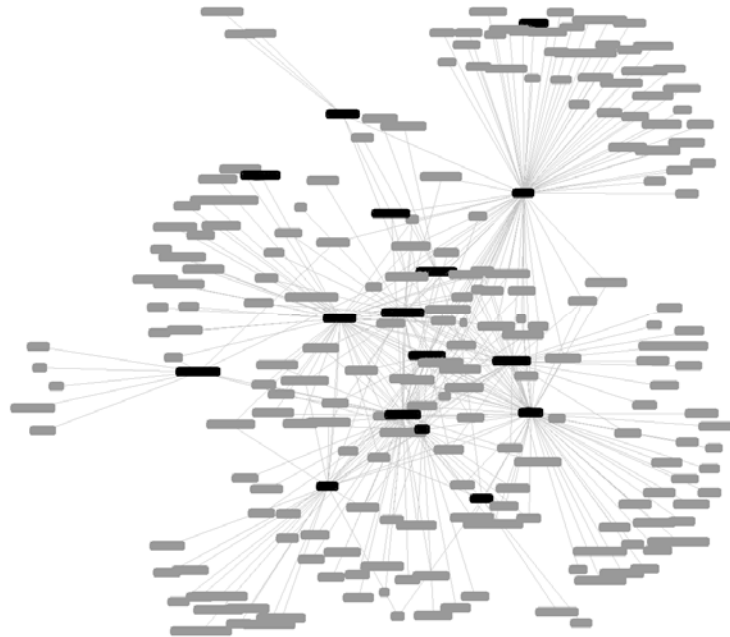

Figure 6: Force Directed Placement of the 20 most-visited Users and their Contacts³

³ For privacy reasons the user names have been blackened in the community graphs.

In order to produce clearly arranged graphs, the number of community members taken into account was reduced. As the twenty users with the highest numbers of visits were responsible for 91% of the community activity, only these twenty and the corresponding conversational partners were taken into account.

In the resulting Figure 6 those nodes that represent the 20 most-visited weblogs are presented in darker shade than the others. Four of these top-twenty users have did not give any comments or create guestbook entries in the analyzed period and were thus removed from the graph. The remaining 16 top-scorers form a tight network with several communities unique to individual users.

As a next step to clarify the social network of the Kleine Zeitung blogspace, only those edges were taken into account that represented three or more communication activities. The resulting graph shows a tight network of eleven of the top score users, while the remaining 9 have no connections to the graph (Figure 7). Four of these eleven users also build their own sub graphs of community activities.

Figure 7: The Community of the most-visited users

6 Conclusions

The analysis on the blogspace of the Kleine Zeitung online community was conducted to find key factors for success of weblogs. The factors activity, number of textual entries, number of images, comments given, comments received, guestbook entries given and guestbook entries received were analyzed in this context. The comparison of the influence of these 7 factors showed that the most important of these factors are

the community activities of the authors, i.e. writing comments and guestbook entries in other blogs.

7 Future Work

The research on the Kleine Zeitung blogspace gave a first hint on the success factors for weblogs. Anyway some open questions remain. In order to better understand the relation of community activity and weblog success a follow-up analysis over a longer period of time is planned for this year.
